---

---

---

---

---

---

---

---

**Introduction**

The purpose of the chapter is to:

1. Understand how the brain is organized, protected, and supplied with blood
2. Compare and contrast the various areas of the brain and their functions
3. Discuss the functional organization of the brain
4. Learn about cranial nerve structure and function

---

---

---

---

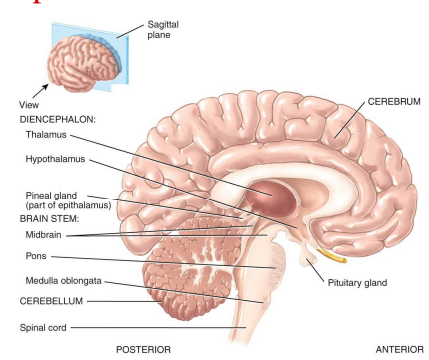

---

---

## Protection

The brain is protected by:

- Cranial bones
- Cranial meninges
  - Pia, arachnoid, and dura mater
    - Cranial dura mater is composed of 2 layers
- Cerebrospinal fluid

Copyright © 2014 John Wiley & Sons, Inc. All rights reserved.

---

---

---

---

---

---

---

---

---

---

---

---

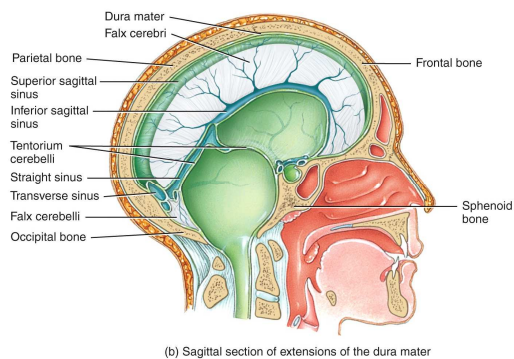

---

### Blood Flow to the Brain

Blood flows to the brain via the vertebral and carotid arteries and flows back to the heart via the jugular veins

Copyright © 2014 John Wiley & Sons, Inc. All rights reserved.

---

---

---

---

---

---

---

---

### Importance of Blood Flow to the Brain

The brain utilizes about 20% of the body's oxygen supply

- Any interruption of the oxygen supply can result in weakening, permanent damage, or death of brain cells
- Glucose deficiency may produce mental confusion, dizziness, convulsions, and unconsciousness

Copyright © 2014 John Wiley & Sons, Inc. All rights reserved.

---

---

---

---

---

---

---

---

### Blood –Brain Barrier (BBB)

The BBB protects brain cells from harmful substances and pathogens by serving as a selective barrier to prevent passage of many substances from the blood into the brain

- The BBB can prevent the entry of therapeutic drugs
- Injury to the brain may cause a breakdown of the BBB, permitting the passage of normally restricted substances into the brain tissue

---

---

---

---

---

---

---

---

---

---

## The Brain Stem

The brain stem is composed of the:

- Medulla oblongata
- Pons
- Midbrain

Copyright © 2014 John Wiley & Sons, Inc. All rights reserved.

---

---

---

---

---

---

---

---

---

---

## Medulla Oblongata

The medulla oblongata is continuous with the superior aspect of the spinal cord and contains portions of both motor and sensory tracts

Transverse section and anterior surface of medulla oblongata

---

---

---

---

---

---

---

---

---

---

## Medulla Oblongata

### Cranial nerves

- Vestibulocochlear and hypoglossal

### Structural regions

- Pyramids
- Inferior olivary nuclei

### Functional regions

- Heart rate, respiratory rate, vasoconstriction, swallowing, coughing, vomiting, sneezing, hiccupping

Copyright © 2014 John Wiley & Sons, Inc. All rights reserved.

---

---

---

---

---

---

---

---

## Pons

The pons is located superior to the medulla oblongata and it links parts of the brain with one another by way of tracts

(b) Sagittal section, medial view  
Copyright © 2014 John Wiley & Sons, Inc. All rights reserved.

---

---

---

---

---

---

---

---

## Pons

### Cranial nerves

- Trigeminal, abducens, facial, and vestibular branch of vestibulocochlear

### Functional regions

- Relays nerve impulses related to voluntary skeletal muscle movements from cerebrum to cerebellum
- Pneumotaxic and apneustic areas (control of respiration)

Copyright © 2014 John Wiley & Sons, Inc. All rights reserved.

---

---

---

---

---

---

---

---

## Midbrain

The midbrain is located superior to the medulla oblongata and extends from the pons to the diencephalon

(a) Posterior view of midbrain in relation to brain stem  
Copyright © 2014 John Wiley & Sons, Inc. All rights reserved.

---

---

---

---

---

---

---

---

## Midbrain

### Cranial nerves

- Oculomotor and trochlear

### Structural regions

- Cerebral peduncles, corpora quadrigemina, substantia nigra, red nuclei, and medial lemniscus

### Functional regions

- Conveys motor impulses from the cerebrum to the cerebellum and spinal cord, sends sensory impulses from the spinal cord to the thalamus, and regulates auditory and visual reflexes

(b) Transverse section of midbrain

---

---

---

---

---

---

---

---

## Reticular Formation

The reticular formation helps regulate muscle tone, alerts the cortex to incoming sensory signals, and is responsible for maintaining consciousness and awakening from sleep

(c) Sagittal section through brain and spinal cord showing the reticular formation

**TABLE 14.2**  
Summary of Functions of Principal Parts of the Brain

PART	FUNCTION
<b>BRAIN STEM</b>	
 Medulla oblongata	<b>Medulla oblongata:</b> Contains sensory (ascending) and motor (descending) tracts. Cardiovascular center regulates heartbeat and blood vessel diameter. Medullary respiratory center (together with pons) regulates breathing. Contains gracile nucleus, cuneate nucleus, gustatory nucleus, cochlear nuclei, and vestibular nuclei (components of sensory pathways to brain). Inferior olivary nucleus provides instructions that cerebellum uses to adjust muscle activity when learning new motor skills. Other nuclei coordinate vomiting, swallowing, sneezing, coughing, and hiccupping. Contains nuclei of origin for vestibulocochlear (VIII), glossopharyngeal (IX), vagus (X), accessory (XI), and hypoglossal (XII) nerves. Reticular formation (also in pons, midbrain, and diencephalon) functions in consciousness and arousal.
 Pons	<b>Pons:</b> Contains sensory and motor tracts. Pontine nuclei relay nerve impulses from motor areas of cerebral cortex to cerebellum. Contains vestibular nuclei (along with medulla) that are part of equilibrium pathway to brain. Pontine respiratory group (together with the medulla) helps control breathing. Contains nuclei of origin for trigeminal (V), abducens (VI), facial (VII), and vestibulocochlear (VIII) nerves.
 Midbrain	<b>Midbrain:</b> Contains sensory and motor tracts. Superior colliculi coordinate movements of head, eyes, and trunk in response to visual stimuli. Inferior colliculi coordinate movements of head, eyes, and trunk in response to auditory stimuli. Substantia nigra and red nucleus contribute to control of movement. Contains nuclei of origin for oculomotor (III) and trochlear (IV) nerves.

---

---

---

---

---

---

---

---

---

---

## The Cerebellum

The cerebellum occupies the inferior and posterior aspects of the cranial cavity and consists of two hemispheres and a central vermis

(a) Superior view  
Copyright © 2014 John Wiley & Sons, Inc. All rights reserved.

---

---

---

---

---

---

---

---

---

---

## The Cerebellum

The cerebellum functions in the coordination of skeletal muscle contractions and in the maintenance of normal muscle tone, posture, and balance

Copyright © 2014 John Wiley & Sons, Inc. All rights reserved.

---

---

---

---

---

---

---

---

---

---

## The Diencephalon

The diencephalon is composed of the:

- Thalamus
- Hypothalamus
- Epithalamus

Copyright © 2014 John Wiley & Sons, Inc. All rights reserved.

---

---

---

---

---

---

---

---

---

---

## Thalamus

The thalamus is located superior to the midbrain and contains nuclei that serve as relay stations for all sensory impulses (except smell) to the cerebral cortex

Copyright © 2014 John Wiley & Sons, Inc. All rights reserved.

---

---

---

---

---

---

---

---

---

---

## Hypothalamus

The hypothalamus is found inferior to the thalamus, has four major regions, controls many body activities, and is one of the major regulators of homeostasis

---

---

---

---

---

---

---

---

---

---

## Epithalamus

The epithalamus lies superior and posterior to the thalamus and contains the pineal gland which secretes melatonin and habenular nuclei which are involved in olfaction

---

---

---

---

---

---

---

---

---

---

## Circumventricular Organs (CVOs) of the Diencephalon

- Parts of the diencephalon, the CVOs, can monitor chemical changes in the blood because they lack a blood-brain barrier
- CVOs include the hypothalamus (a portion of it), pineal gland, and the pituitary gland
  - CVOs coordinate homeostatic activities of the endocrine and nervous systems

---

---

---

---

---

---

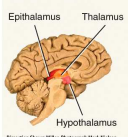

---

---

---

---

**TABLE 14.2**  
**Summary of Functions of Principal Parts of the Brain**

PART	FUNCTION
<b>DIENCEPHALON</b>	
 <p>Epithalamus Thalamus Hypothalamus</p> <p><i>Illustration: Shaun Miller, Photograph: Mark Nelson</i></p>	<p><b>Thalamus:</b> Relays almost all sensory input to cerebral cortex. Contributes to motor functions by transmitting information from cerebellum and basal nuclei to primary motor area of cerebral cortex. Plays role in maintenance of consciousness.</p> <p><b>Hypothalamus:</b> Controls and integrates activities of autonomic nervous system. Produces hormones, including releasing hormones, inhibiting hormones, oxytocin, and antidiuretic hormone (ADH). Regulates emotional and behavioral patterns (together with limbic system). Contains feeding and satiety centers (regulate eating), thirst center (regulates drinking), and suprachiasmatic nucleus (regulates circadian rhythms). Controls body temperature by serving as body's thermostat.</p> <p><b>Epithalamus:</b> Consists of pineal gland (secretes melatonin) and habenular nuclei (involved in olfaction).</p>

### The Cerebrum

The cerebral cortex is composed of gray matter which contains billions of neurons

- Gyri, fissures, and sulci can be identified on the cortex

Deep to the cortex is white matter composed of tracts of neurons that connect parts of the brain to each other and the spinal cord

- A bundle of white matter tracts called the corpus callosum connects the right and left hemispheres of the cerebrum

## Lobes of the Cerebrum

The cerebrum can be divided into the:

- Frontal lobe
- Parietal lobe
- Temporal lobe
- Occipital lobe
- Insula

(b) Right lateral view

---

---

---

---

---

---

---

---

## Functional Organization of the Cerebral Cortex

Specific types of sensory, motor, and integrative signals are processed in certain regions of the cerebral cortex. There are:

- Sensory areas
- Motor areas
- Association areas

## Cranial Nerves

TABLE 14.4

### Summary of Cranial Nerves\*

CRANIAL NERVE	COMPONENTS	PRINCIPAL FUNCTIONS
Olfactory (I)	Special sensory	Olfaction (smell).
Optic (II)	Special sensory	Vision (sight).
Oculomotor (III)	Motor	Movement of eyeballs and upper eyelid.
	Somatic	Adjusts lens for near vision (accommodation).
Trochlear (IV)	Motor	Constriction of pupil.
	Somatic	Movement of eyeballs.
Trigeminal (V)	Mixed	
	Sensory	Touch, pain, and thermal sensations from scalp, face, and oral cavity (including teeth and anterior two-thirds of tongue).
	Motor (branchial)	Chewing and controls middle ear muscle.
Abducens (VI)	Motor	Movement of eyeballs.
Facial (VII)	Mixed	
	Sensory	Taste from anterior two-thirds of tongue.
	Motor (branchial)	Touch, pain, and thermal sensations from skin in external ear canal.
	Motor (autonomic)	Control of muscles of facial expression and middle ear muscle. Secretion of tears and saliva.
Vestibulocochlear (VIII)	Special sensory	Hearing and equilibrium.

## Cranial Nerves

TABLE 14.4

### Summary of Cranial Nerves\*

CRANIAL NERVE	COMPONENTS	PRINCIPAL FUNCTIONS
Glossopharyngeal (IX)	Mixed	
	Sensory	Taste from posterior one-third of tongue.
	Motor (branchial)	Proprioception in some swallowing muscles.
	Motor (autonomic)	Monitors blood pressure and oxygen and carbon dioxide levels in blood. Touch, pain, and thermal sensations from skin of external ear and upper pharynx. Assists in swallowing. Secretion of saliva.
Vagus (X)	Mixed	
	Sensory	Taste from epiglottis.
	Motor (branchial)	Proprioception from throat and voice box muscles.
	Motor (autonomic)	Monitors blood pressure and oxygen and carbon dioxide levels in blood. Touch, pain, and thermal sensations from skin of external ear. Sensations from thoracic and abdominal organs.
Accessory (XI)	Motor	Swallowing, vocalization, and coughing.
	Branchial	Modality and secretion of gastrointestinal organs. Constriction of respiratory passageways. Decreases heart rate.
Hypoglossal (XII)	Motor	
	Somatic	Movement of head and pectoral girdle.
	Somatic	Speech, manipulation of food, and swallowing.

---

---

---

---

## Development of the Nervous System

The development of the nervous system begins with a thickening of the ectoderm called the neural plate

Copyright © 2014 John Wiley & Sons, Inc. All rights reserved.

---

---

---

---

---

---

---

---

## Development of the Nervous System

The parts of the brain develop from secondary vesicles

Copyright © 2014 John Wiley & Sons, Inc. All rights reserved.

---

---

---

---

---

---

---

---

### Aging and the Nervous System

Aging can result in:

- Loss of neurons
- Diminished capacity for sending nerve impulses to and from the brain
- Diminished ability to process information
- Decreased conduction velocity
- Slowing of voluntary motor movements
- Increased reflex time
- Degenerative changes in vision, hearing, sight, taste, smell, touch, and balance

Copyright © 2014 John Wiley & Sons, Inc. All rights reserved.

---

---

---

---

---

---

---

---

### Disorders: Homeostatic Imbalances

- Cerebrovascular accident (stroke)
- Transient ischemic attack (TIA)
- Alzheimer's disease
