---

---

---

---

---

---

---

---

**The Urinary System**

Consists of the kidneys, ureters, bladder, and urethra

Maintains homeostasis by managing the volume and composition of fluid reservoirs, primarily blood

Copyright © 2014, John Wiley & Sons, Inc. All rights reserved.

---

---

---

---

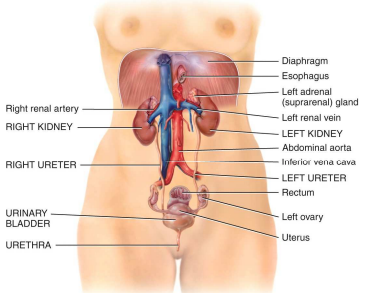

---

---

---

---

**Organs of the urinary system in a female**

Right renal artery  
RIGHT KIDNEY  
RIGHT URETER  
URINARY BLADDER  
URETHRA

Diaphragm  
Esophagus  
Left adrenal (suprarenal) gland  
Left renal vein  
LEFT KIDNEY  
Abdominal aorta  
Inferior vena cava  
LEFT URETER  
Rectum  
Left ovary  
Uterus

---

---

---

---

### Homeostatic Kidney Functions

Regulation of blood ionic composition

Na<sup>+</sup>, K<sup>+</sup>, Cl<sup>-</sup>

Regulation of blood pH

H<sup>+</sup>, HCO<sub>3</sub><sup>-</sup>

Regulation of blood volume

H<sub>2</sub>O

Regulation of blood pressure

Copyright © 2014 John Wiley & Sons, Inc. All rights reserved.

---

---

---

---

---

---

---

---

### Homeostatic Kidney Functions

Maintenance of blood osmolarity

Production of hormones

Calcitriol and Erythropoietin

Regulation of blood glucose level

Excretion of metabolic wastes and foreign substances (drugs or toxins)

Copyright © 2014 John Wiley & Sons, Inc. All rights reserved.

---

---

---

---

---

---

---

---

### Renal Anatomy

The kidneys are retroperitoneal, partly protected by the lower ribs.

(a) Inferior view of transverse section of abdomen (L2)

Copyright © 2014 John Wiley & Sons, Inc. All rights reserved.

Copyright © 2014 John Wiley & Sons, Inc. All rights reserved.

---

---

---

---

---

---

---

---

### Renal Anatomy

The indented area is called the **Hilum**.

This is the entrance for:

Renal Artery

Renal Vein

Ureter

Nerves

Lymphatics

Copyright © 2014 John Wiley & Sons, Inc. All rights reserved.

---

---

---

---

---

---

---

---

### External Layers

Connective Tissue, Superficial to Deep

- Renal Fascia - Anchors to other structures
- Adipose Capsule – Protects and anchors
- Renal Capsule – Continuous with Ureter

Copyright © 2014 John Wiley & Sons, Inc. All rights reserved.

---

---

---

---

---

---

---

---

### Internal Renal Anatomy

Renal Cortex – Outer layer

Renal Medulla – Inner region

Renal Pyramids – Secreting Apparatus and Tubules

Renal Columns – Anchor the Cortex

Copyright © 2014 John Wiley & Sons, Inc. All rights reserved.

---

---

---

---

---

---

---

---

### Internal Renal Anatomy

Copyright © 2014 John Wiley & Sons, Inc. All rights reserved.  
 Copyright © 2014 John Wiley & Sons, Inc. All rights reserved.

---

---

---

---

---

---

---

---

### Internal Renal Anatomy

Papillary ducts empty urine into calyces  
 Calyces pass urine to the Ureter

(a) Anterior view of dissection of right kidney

---

---

---

---

---

---

---

---

### Blood and Nerve supply of the Kidneys

#### Blood supply

Although kidneys constitute less than 0.5% of total body mass, they receive 20–25% of resting cardiac output

#### Nerve Supply

Renal Nerves primarily carry sympathetic outflow  
 They regulate blood flow through the kidneys

Copyright © 2014 John Wiley & Sons, Inc. All rights reserved.

---

---

---

---

---

---

---

---

### The Renal Corpuscle

The Glomerular (Bowman's) Capsule has a visceral layer of podocytes which wrap around the capillaries.

The filtrate is collected between the visceral and parietal layers.

Copyright © 2014 John Wiley & Sons, Inc. All rights reserved.

---

---

---

---

---

---

---

---

### Histology of a Renal Corpuscle

Copyright © 2014 John Wiley & Sons, Inc. All rights reserved.

---

---

---

---

---

---

---

---

### The Renal Corpuscle

The glomerular endothelial cells have large pores (fenestrations) and are leaky.

Basal lamina lies between endothelium and podocytes.

Podocytes form pedicels, between which are filtration slits.

Copyright © 2014 John Wiley & Sons, Inc. All rights reserved.

---

---

---

---

---

---

---

---

## The Renal Corpuscle

Copyright © 2014 John Wiley & Sons, Inc. All rights reserved.

---

---

---

---

---

---

---

---

---

---

## The Renal Tubule

The filtrate passes from the glomerular capsule to the renal tubule

Proximal Convoluted Tubule

Nephron Loop  
Descending Loop  
Ascending Loop

Distal Convoluted Tubule

Copyright © 2014 John Wiley & Sons, Inc. All rights reserved.

---

---

---

---

---

---

---

---

---

---

## The Juxtaglomerular Apparatus

The ascending loop contacts the afferent arteriole at the macula densa.

The wall of the arteriole contains smooth muscle cells; juxtaglomerular cells.

The apparatus regulates blood pressure in the kidney in conjunction with the ANS.

---

---

---

---

---

---

---

---

---

---

## The Distal Collecting Tubule and Collecting Duct

Principal Cells – receptors for ADH and aldosterone  
 Intercalated Cells – help to manage blood pH

Copyright © 2014 John Wiley & Sons, Inc. All rights reserved.

Copyright © 2014 John Wiley & Sons, Inc. All rights reserved.

---

---

---

---

---

---

---

---

---

---

## Two Kinds of Nephrons

Cortical nephrons – 80-85% of nephrons  
 Renal corpuscle in outer portion of cortex  
 Short loops of Henle extend only into outer region of medulla  
 Create urine with osmolarity similar to blood

Copyright © 2014 John Wiley & Sons, Inc. All rights reserved.

---

---

---

---

---

---

---

---

---

---

## Juxtamedullary Nephrons

Renal corpuscle deep in cortex with long nephron loops

Receive blood from peritubular capillaries and vasa recta

Ascending limb has thick and thin regions

Enable kidney to secrete very concentrated urine

Copyright © 2014, John Wiley & Sons, Inc. All rights reserved.

---

---

---

---

---

---

---

---

---

---

## Cortical

## Juxtamedullary

---

---

---

---

---

---

---

---

---

## Renal Physiology - Urine Formation

- Glomerular filtration
- Tubular reabsorption
- Tubular secretion

Copyright © 2014, John Wiley & Sons, Inc. All rights reserved.

Excretion of a solute = glomerular filtration + secretion - reabsorption

Copyright © 2014, John Wiley & Sons, Inc. All rights reserved.

---

---

---

---

---

---

---

---

---

---

### Glomerular Filtration

Driven by blood pressure

Opposed by capsular hydrostatic pressure and blood colloid osmotic pressure

Water and small molecules move out of the glomerulus.

In one day, 150–180 liters of water pass out into the glomerular capsule.

Copyright © 2014 John Wiley & Sons, Inc. All rights reserved.

---

---

---

---

---

---

---

---

### Glomerular filtration

Glomerular filtration rate – amount of filtrate formed by both kidneys each minute

Homeostasis requires kidneys to maintain a relatively constant GFR

Too high – substances pass too quickly and are not reabsorbed

Too low – nearly all reabsorbed and some waste products not adequately excreted

Copyright © 2014 John Wiley & Sons, Inc. All rights reserved.

---

---

---

---

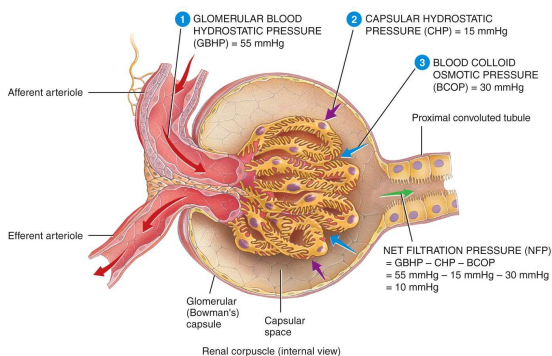

---

---

---

---

### Glomerular Filtration

Copyright © 2014 John Wiley & Sons, Inc. All rights reserved.

---

---

---

---

---

---

---

---

## Glomerular Filtration

### Interactions Animation:

- [Renal Filtration](#)

You must be connected to the Internet and in Slideshow Mode to run this animation.

Copyright © 2014 John Wiley & Sons, Inc. All rights reserved.

---

---

---

---

---

---

---

---

## Glomerular Filtration Rate

GFR averages 125mL/min in males and 105mL/min in females

Controlled by:

- Renal Autoregulation
- Neural Regulation
- Hormonal Regulation

Copyright © 2014 John Wiley & Sons, Inc. All rights reserved.

---

---

---

---

---

---

---

---

## Renal Autoregulation

### Myogenic Mechanism

Smooth muscle cells in afferent arterioles contract in response to elevated blood pressure

### Tubuloglomerular Feedback

- High GFR diminishes reabsorption
- Macula Densa inhibits release of nitric oxide
- Afferent arterioles constrict

Copyright © 2014 John Wiley & Sons, Inc. All rights reserved.

---

---

---

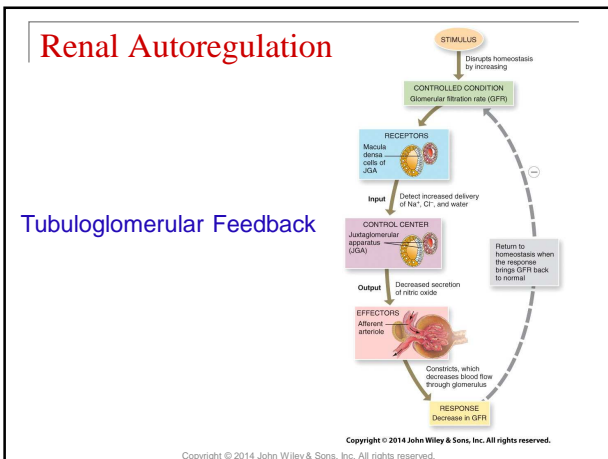

---

---

---

---

---

---

---

---

---

---

---

---

---

### Neural Regulation

Kidneys are richly supplied by sympathetic fibers.

Strong stimulation (exercise or hemorrhage)—afferent arterioles are constricted.

Urine output is reduced, and more blood is available for other organs.

Copyright © 2014 John Wiley & Sons, Inc. All rights reserved.

---

---

---

---

---

---

---

---

### Hormonal Regulation

Angiotensin II constricts afferents and efferents, diminishing GFR.

Atrial Natriuretic Peptide relaxes mesangial cells, increasing capillary surface area and GFR.

ANP is secreted in response to stretch of the cardiac atria.

Copyright © 2014 John Wiley & Sons, Inc. All rights reserved.

---

---

---

---

---

---

---

---

### Tubular Reabsorption and Secretion

Much of the filtrate is reabsorbed  
 Especially water, glucose, amino acids, and ions  
 Secretion helps to manage pH and rid the body of toxic and foreign substances.

Copyright © 2014 John Wiley & Sons, Inc. All rights reserved.

---

---

---

---

---

---

---

---

### Plasma, Filtrate and Urine Compositions

	Total Amount in Plasma	Amount in 180 L of filtrate (/day)	Amount returned to blood/d (Reabsorbed)	Amount in Urine (/day)
Water (passive)	3 L	180 L	178-179 L	1-2 L
Protein (active)	200 g	2 g	1.9 g	0.1 g
Glucose (active)	3 g	162 g	162 g	0 g
Urea (passive)	1 g	54 g	24 g (about 1/2)	30 g (about 1/2)
Creatinine	0.03 g	1.6 g	0 g (all filtered)	1.6 g (none reabsorbed)

Copyright © 2014 John Wiley & Sons, Inc. All rights reserved.

---

---

---

---

---

---

---

---

### Tubular Reabsorption and Secretion

Much of the filtrate is reabsorbed by both active and passive processes.  
 Especially water, glucose, amino acids, and ions  
 Secretion helps to manage pH and rid the body of toxic and foreign substances.

Copyright © 2014 John Wiley & Sons, Inc. All rights reserved.

---

---

---

---

---

---

---

---

### Reabsorption Routes

#### Paracellular Reabsorption

Passive fluid leakage between cells

#### Transcellular Reabsorption

Directly through the tubule cells

Copyright © 2014 John Wiley & Sons, Inc. All rights reserved.

---

---

---

---

---

---

---

---

### Reabsorption Routes

Copyright © 2014 John Wiley & Sons, Inc. All rights reserved.

---

---

---

---

---

---

---

---

### Transport Mechanisms

#### Primary Active Transport

Uses ATP, like Na<sup>+</sup>/K<sup>+</sup> pumps

At rest, accounts for 6% total body ATP use

#### Secondary Active Transport

Driven by ion's electrochemical gradient

Symporters move substances in same direction

Antiporters move substances in opposite directions

Copyright © 2014 John Wiley & Sons, Inc. All rights reserved.

---

---

---

---

---

---

---

---

### Passive Reabsorption in the late PCT

Copyright © 2014 John Wiley & Sons, Inc. All rights reserved.  
Copyright © 2014 John Wiley & Sons, Inc. All rights reserved.

---

---

---

---

---

---

---

---

---

---

### Reabsorption in the Loop of Henle

Relatively impermeable to water, especially the ascending limb

Little obligatory water reabsorption

$\text{Na}^+ - \text{K}^+ - 2\text{Cl}^-$  symporters

Copyright © 2014 John Wiley & Sons, Inc. All rights reserved.

---

---

---

---

---

---

---

---

---

---

### Reabsorption in the Nephron Loop

Copyright © 2014 John Wiley & Sons, Inc. All rights reserved.  
Copyright © 2014 John Wiley & Sons, Inc. All rights reserved.

---

---

---

---

---

---

---

---

---

---

### Reabsorption in early DCT

Na<sup>+</sup> - Cl<sup>-</sup> symporters reabsorb ions  
 PTH stimulates reabsorption of Ca<sup>2+</sup>  
 It also inhibits phosphate reabsorption in the PCT, enhancing its excretion

Copyright © 2014 John Wiley & Sons, Inc. All rights reserved.

---

---

---

---

---

---

---

---

### Late DCT and Collecting Duct

Principal Cells  
 Na<sup>+</sup>-K<sup>+</sup> pumps reabsorb Na<sup>+</sup>  
 Aquaporin – 2 reabsorbs water  
 Stimulated by ADH  
 Intercalated Cells  
 Reabsorb K<sup>+</sup> + HCO<sub>3</sub><sup>-</sup>, secrete H<sup>+</sup>

Copyright © 2014 John Wiley & Sons, Inc. All rights reserved.

---

---

---

---

---

---

---

---

### Regulation of Water Reabsorption by ADH

Facultative Reabsorption

Negative Feedback

Copyright © 2014 John Wiley & Sons, Inc. All rights reserved.

Copyright © 2014 John Wiley & Sons, Inc. All rights reserved.

---

---

---

---

---

---

---

---

**Urine Production**

Fluid intake is highly variable.  
Homeostasis requires maintenance of fluid volumes within specific limits.  
Urine concentration varies with ADH.

Copyright © 2014 John Wiley & Sons, Inc. All rights reserved.

---

---

---

---

---

---

---

---

**Urine Production**

High intake – Dilute urine of high volume  
Low intake – Concentrated urine of low volume

Copyright © 2014 John Wiley & Sons, Inc. All rights reserved.

---

---

---

---

---

---

---

---

**Formation of Dilute Urine**

Glomerular filtrate and blood have the same osmolarity – 300mOsm/Liter  
Tubular osmolarity changes due to a concentration gradient in the medulla

Copyright © 2014 John Wiley & Sons, Inc. All rights reserved.

---

---

---

---

---

---

---

---

### Formation of Dilute Urine

When dilute urine is formed, osmolarity in the tubule

1. Increases in the descending limb
2. Decreases in the ascending limb
3. Decreases more in the collecting duct

Copyright © 2014 John Wiley & Sons, Inc. All rights reserved.

---

---

---

---

---

---

---

---

### Formation of Dilute Urine

#### Tubule Osmolarity

- ↑ in descending limb
- ↓ in ascending limb
- ↓ in collecting duct

Copyright © 2014 John Wiley & Sons, Inc. All rights reserved.

---

---

---

---

---

---

---

---

### Formation of Dilute Urine

#### Thick Ascending Limb

Symporters actively resorb  $\text{Na}^+$ ,  $\text{K}^+$ ,  $\text{Cl}^-$

Low water permeability

Solute leave, water stays in tubule

#### Collecting Duct

Low water permeability in absence of ADH

Copyright © 2014 John Wiley & Sons, Inc. All rights reserved.

---

---

---

---

---

---

---

---

## Formation of Concentrated Urine

In presence of ADH, collecting ducts become very permeable to water.

Tubular fluid there becomes very concentrated.

Movement of water also carries urea into the medulla, contributing to its osmolarity.

Copyright © 2014 John Wiley & Sons, Inc. All rights reserved.

---

---

---

---

---

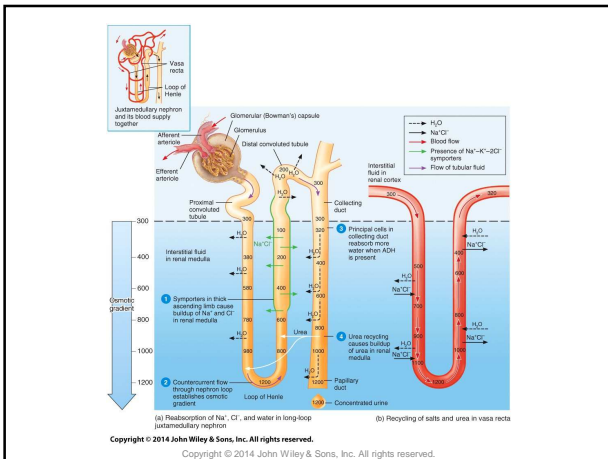

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

## Countercurrent Exchange

Loop and duct cells require nutrients and oxygen from blood supply.

Capillaries that feed them (vasa recta) form loops like those of nephron loops in the medulla.

Incoming and outgoing blood will have similar osmolarity.

This maintains medulla concentration gradient.

Copyright © 2014 John Wiley & Sons, Inc. All rights reserved.

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

## Tubular Reabsorption

Interactions Animation:

Water Homeostasis

You must be connected to the Internet and in Slideshow Mode to run this animation.

Copyright © 2014 John Wiley & Sons, Inc. All rights reserved.

---

---

---

---

---

---

---

---

---

---

---

---

## Evaluation of Kidney Function

Routine urinalysis primarily evaluates for the presence of abnormalities in the urine:

- Albumin
- Glucose
- Red blood cells
- Ketone bodies
- Microbes

Copyright © 2014 John Wiley & Sons, Inc. All rights reserved.

---

---

---

---

---

---

---

---

---

---

---

---

## Urine Transportation and Storage

Each ureter transports urine from a renal pelvis by peristaltic waves, hydrostatic pressure, and gravity.

No anatomical valve at the opening of the ureter into bladder – when bladder fills, it compresses the opening and prevents backflow.

The bladder is a hollow, distensible, muscular organ with a capacity averaging 700–800 mL.

Copyright © 2014 John Wiley & Sons, Inc. All rights reserved.

---

---

---

---

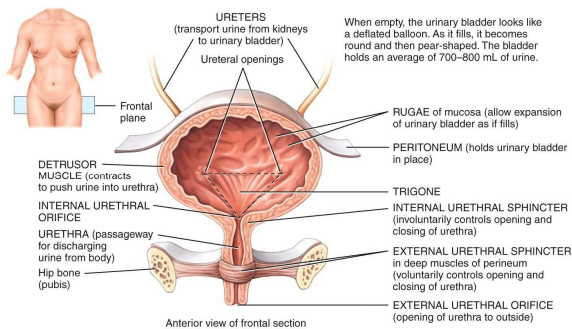

---

---

---

---

## Ureters, Bladder, and Urethra in a female

Copyright © 2014 John Wiley & Sons, Inc. All rights reserved.

Copyright © 2014 John Wiley & Sons, Inc. All rights reserved.

---

---

---

---

---

---

---

---

## Micturition

The discharge of urine involves voluntary and involuntary muscle contractions.

Stretch receptors trigger a spinal reflex, which we learn to control in childhood.

The urethra carries urine from the internal urethral orifice to the exterior of the body.

In males, it discharges semen as well as urine.

Copyright © 2014 John Wiley & Sons, Inc. All rights reserved.

---

---

---

---

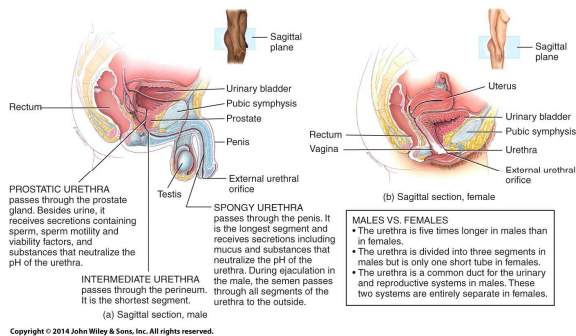

---

---

---

---

## Male and Female Urethras

---

---

---

---

---

---

---

---

---

---

---

---

## End of Chapter 26
